Water Filter Mechanical Leak Detector with Auto Shut Off Valve

Stops major damage to your cupboards, floor or home by cutting off water supply to filter.

Auto Leak Detector protects your water filtration system from leakage by performing an automatic system shut-down upon detection of any water leakage.

Automatic shut off when water leak is detected on the floor.

1/4 quick connect fittings.

Leak Detector Shut Off Valve Push Fit protects from leaks by blocking the supply of water without additional force upon the leakage within the water water filtration system.

It will need to be fixed to the bottom of the cupboard or floor (2 screws inc).

It can be easily re-used by replacing the capsule.

Works With 1/4" hose Water Filters, Reverse Osmosis System, Aquarium, Refrigerator Water.

How it works:

A highly absorbent capsule (pad) sits in place under the shut off valve.

It quickly absorbs any leaking water causing the capsule to expand putting pressure on the shut off valve.

The inlet water flow will stop when sufficient water has been absorbed.

It stops the inlet water flow and stops any further leaking after the valve avoiding any possible water damage.
